Product of conception—gestational age, completed weeks N[N]

Identifying and definitional attributes

Metadata item type:	Data Element
Short name:	Gestational age
METEOR identifier:	669039
Registration status:	Health! , Superseded 12/12/2018
Definition:	The age of a product of conception in completed weeks.

Data element concept attributes

Identifying and definitional attributes

Data element concept:	Product of conception—gestational age
METEOR identifier:	298108
Registration status:	Health! , Superseded 12/12/2018 Tasmanian Health , Superseded 03/07/2020
Definition:	The age of a product of conception.
Context:	Perinatal statistics
Object class:	Product of conception
Property:	Gestational age

Value domain attributes

Identifying and definitional attributes

Value domain:	Total weeks N[N]
METEOR identifier:	308220
Registration status:	Health! , Standard 02/12/2009 Indigenous , Standard 16/09/2014 Tasmanian Health , Standard 20/12/2016
Definition:	Total number of completed weeks.

Representational attributes

Representation class:	Total				
Data type:	Number				
Format:	N[N]				
Maximum character length:	2				
Supplementary values:	<table><thead><tr><th>Value</th><th>Meaning</th></tr></thead><tbody><tr><td>99</td><td>Not stated/unknown</td></tr></tbody></table>	Value	Meaning	99	Not stated/unknown
Value	Meaning				
99	Not stated/unknown				
Unit of measure:	Completed weeks				

Data element attributes

Collection and usage attributes

Guide for use: Gestational age is the best clinical estimate of the duration of pregnancy at a specific point in time, based on the first day of the last menstrual period, ultrasound or physical examination of the baby.

Gestational age is conventionally expressed in completed weeks. When gestational age is calculated using the first day of the last normal menstrual period, the first day is counted as day zero and not day one. Therefore, a 25 week, 5 day fetus is considered a 25 week fetus (25+0, 25+1, 25+2, 25+3, 25+4, 25+5, 25+6).

When ultrasound is used to date a pregnancy, the earliest ultrasound examination should be used and should preferably be between 6 and 10 weeks gestation. Scans performed beyond 24 weeks gestation are unlikely to be reliable in estimating gestational age and should not be used for this purpose.

The World Health Organization identifies the following categories for duration of gestation:

- pre-term: less than 37 completed weeks (less than 259 days) of gestation
- term: from 37 completed weeks to less than 42 completed weeks (259 to 293 days) of gestation
- post-term: 42 completed weeks or more (294 days or more) of gestation.

Comments: Gestational age is a key marker in pregnancy and an important risk factor for neonatal outcomes.

Implementation in Data Set Specifications:

[Perinatal NMDS 2018-19](#)

[Health!](#), Superseded 12/12/2018

Implementation start date: 01/07/2018

Implementation end date: 30/06/2019

DSS specific information:

The first day of the last menstrual period (LMP) is required to estimate gestational age, which is a key outcome of pregnancy and an important risk factor for neonatal outcomes. Although the date of the LMP may not be known, or may sometimes be erroneous, estimation of gestational age based on clinical assessment may also be inaccurate. Gestational age is usually estimated based on available information on LMP and clinical assessment.

In the case of multiple births, this item should be recorded for each baby born.
